# METAL ROOFING DESIGN REVIEW SUPPLEMENT

## ROLLED STANDING SEAM

Most historically appropriate. Panels are extruded with “candy cane” edges that lap over the adjacent panel. Hidden fastener clips along one edge of panel only. After panels are lapped, fastened, and crimped, a machine is set over the seal at the top and drives itself down the roof while it pulls together and rolls over the seam.

## LOW-PROFILE “SNAP-LOCK

Appropriate in all districts. Less expensive option to mechanically rolled seam.

## 5-V

Appropriate in all districts.

## RIBBED

Appropriate for roof planes not visible from a public right-of-way or for an outbuilding.

## CORRUGATED

Appropriate for outbuildings.

## UNAPPROVED METAL ROOFING

Snap-lock standing seam with tall seams, metal that looks like another material such as wood, slate, or tile
